

Otilia Ivănoiu

A: România | E: otilia.vod@gmail.com | P: +40 749 633 411 |

G: <https://github.com/otiliavod>

Professional Summary

Full Stack Developer with hands-on experience in Angular, Java (Spring Boot), and Node.js environments. Strong background in building secure REST APIs, real-time systems, and modern responsive UIs. Experienced in agile teams, CI/CD pipelines, and collaborative software development. Passionate about clean architecture, scalable systems, and continuous learning. Check out my website: <https://ivera-digital.netlify.app/>

Areas of experience: web development

Abilities: teamwork, communication, attention to details, adaptability

Education

Oct 2021 – 2024	Faculty of Sciences, Physical Education and Informatics, Bachelor's Degree in Informatics National University of Science and Technology Politehnica Bucharest	Pitești, România
--------------------	--	---------------------

Technical Skills

- Frontend: Angular (signals, RxJS, Reactive Forms), PrimeNG, Vue.js, TypeScript, JavaScript, HTML, CSS
- Backend: OOP, Java (Spring Boot), Node.js, Express

- Databases: PostgreSQL, SQLite
- Authentication & Security: JWT, OTP (passwordless auth), BCrypt
- DevOps & Tools: Docker, Git, Github, Postman, CI/CD pipelines
- Architecture: REST APIs, role-based systems, session management

Other Information

Driving license	• Cat. AM, B1, B (from August 2016)
Languages	• Romanian (native) • English (advanced) • French (beginner)
Passions and hobbies	• Technology • Books • Travelling

Trainings

Betfair Romania Development Java Bootcamp: October 2021 - November 2021

Project Description:

The project - **Electric Scooters Rental Application** - was split between five teams of students, each team working on one major individual feature. I was assigned to the payments team, which was in charge of the credit card payment logic. Each member of the team picked their own issues to work on, creating their own separate branch. After the feature was implemented, we created pull requests to get our code reviewed by our mentors in order to get feedback for improvements and merge our changes into the main branch. The project was created with Java, using Spring Boot and GitHub for version control. We also used Firebase and Heroku for deployment.

Responsibilities:

I worked on two issues doing both backend and frontend, update card data and remove card. On the update card data issue I had to select a card from a list and update its fields (all of them or individually). If the card was expired, the user should change the expiry date and CVV number. I also added the option for the user to update the cardholder's name. For remove card issue I created the logic necessary for the deletion of a card based on its id.

Employment

Betfair Romania Development: June 2022 - June 2025

Role: Full Stack Developer

- Collaborated with a cross-functional development team to maintain and enhance features for Betfair applications across both desktop and mobile platforms.
- Contributed to frontend development using Vue.js, implementing UI improvements and bug fixes.
- Supported backend development using Java and Spring Boot, working on service enhancements, data handling, and API integrations.
- Gained hands-on experience with CI/CD pipelines, including building, testing, and deploying application updates to staging and production environments.
- Developed a strong understanding of agile workflows, version control (Git), and team collaboration tools (e.g., Jira, Confluence).

Personal Projects

1. Resource Hub:

Resource Hub is a full-stack web application for managing clients, projects, timesheets, and employee leave in one place. It is built with a modern Angular frontend and a NestJS backend, using PostgreSQL with Prisma ORM.

Tech Stack:

1. Frontend:
 - Angular 21 (standalone components)
 - PrimeNG UI library
 - RxJS
 - HTTP Interceptor for authentication
2. Backend:
 - NestJS
 - Prisma ORM
 - PostgreSQL
 - JWT Authentication
 - Bcrypt password hashing
3. Infrastructure:
 - Docker
 - Docker compose
 - PostgreSQL container

Features:

1. Authentication:
 - Register and login
 - JWT access tokens
 - Refresh token rotation
 - Secure cookie refresh flow
 - Password validation rules
2. Dashboard
 - Weekly hours summary
 - Timesheet activity visualization
 - Team member stats
 - Upcoming leave overview

3. Leave Management

- Leave balance tracking
- Leave request system
- Approval status (pending, approved, rejected)

4. Projects & Clients

- Client management
- Project tracking
- Project team membership
- Time tracking per project

Repository: <https://github.com/otiliavod/resource-hub>

2. Ivera Digital — Presentation Website (AI-generated project):

I engineered a modern single-page presentation website following scalable frontend architecture principles. I implemented standalone Angular components, modular data-driven content configuration, and reusable UI sections (Hero, Projects, Team, Contact). I integrated smooth-scroll navigation, dynamic glass-effect header behavior, and responsive layout strategies.

I also emphasized clean separation of concerns, maintainable folder structure, and production-ready UI composition suitable for agency-grade applications.

Live server: <https://ivera-digital.netlify.app/>

3. Workflow — Task Management App (Full Stack):

A lightweight full-stack task collaboration system built with Angular + PrimeNG on the frontend and Express + SQLite on the backend.

It supports real-time task updates, user authentication, collaborators, and status management across roles (*Owner, Collaborator, Viewer*).

Workflow lets users:

- Create, edit, and track tasks
- Assign collaborators
- Change task statuses (New → In Progress → Completed)
- Manage permissions (Owner, Collaborator, Viewer)
- Authenticate without passwords (email + one-time code)
- View updates in real time

The app uses a minimal REST API backend with socket notifications and a reactive Angular frontend.

Repository: <https://github.com/otiliavod/training-app-main>

4. CityHall Presentation Website(AI-generated project):

I developed a structured municipal presentation system simulating a digital transparency and public information portal. I designed reusable layout components, modular page sections, and scalable routing architecture. Focused on state-driven UI rendering, structured content hierarchies, and clear information presentation, I believe it demonstrates ability to design enterprise-style frontend applications with maintainable structure and extensible architecture.

Live server: <https://cityhall-presentation.netlify.app/>

5. Online Store Application (AI-generated project):

I built an e-commerce simulation platform showcasing product listings, category filtering, cart management, and dynamic UI updates. I implemented reusable product components, cart synchronization logic, and scalable folder organization.

I chose to focus on state consistency, modular UI composition, and frontend logic commonly found in real-world commerce systems.

The website highlights understanding of user interaction flows, structured state management, and maintainable frontend design patterns.
